

Dear Spyrosoft Hiring Team, I'm excited to apply for the Android Automotive Application Developer role. Over 9 years as a Senior Android Engineer, I've built real-time hardware-to-app communication and Smart Device/IoT integrations at Arlo, using Kotlin, Coroutines, and Flow to manage device connectivity, security features, and BLE-based communication — experience that maps directly to the constraints of in-vehicle infotainment systems. I've also architected Clean Architecture systems from scratch, integrated REST APIs and offline-capable flows, and driven performance optimization achieving ~100% test coverage on hardware-constrained features. My background spans Jetpack Compose UI work, Agile team leadership, and CI/CD automation, all of which I'd bring to porting navigation and map features into your Android Automotive OS environment. I'd welcome the chance to discuss how my hardware-integration and performance-optimization experience can support your team.
