

Dear Hiring Team,

I'm writing to apply for the Android Automotive Application Developer role at Spyrosoft. Over 9 years as a Senior Android Engineer, I've built high-scale B2C applications in Kotlin and Jetpack Compose, and at Arlo I architected real-time hardware-to-app communication and Smart Device integration for a Camera UX migration using Coroutines and Flow, which mirrors the kind of embedded, hardware-close UX work this role involves. My experience optimizing performance and resolving memory leaks in constrained, high-traffic applications at Turkcell speaks directly to the need for stability on constrained hardware platforms. I've also architected a Clean Architecture system from scratch at Halyk Bank and driven CI/CD and quality-gate practices across multiple teams, so I'm comfortable owning both the technical foundation and the delivery process. I work well in Agile, cross-functional environments alongside UX, backend, and integration teams, as demonstrated throughout my roles at Zalando and Slice. I'd welcome the opportunity to bring this background to your Android Automotive OS navigation product.
