

Dear Hiring Team,

I'm excited to apply for the Senior Android Automotive Engineer role at Intellias. Over 9 years in Android engineering, I've architected real-time hardware-to-app communication at Arlo, using Coroutines and Flow to manage Smart Device integrations and security-critical features — work that maps closely to the concurrency, HAL-adjacent, and system-level challenges of an AOSP media-casting platform. I've also built Clean Architecture from scratch for a trading application at Halyk Bank, led a team of 5 in an Agile environment, and driven TDD practices to near-100% coverage on critical features at both Arlo and Turkcell. Beyond hands-on engineering, I've conducted 50+ Android technical interviews at Vention and mentored developers through the Belarus Kotlin User Group, so I'm comfortable contributing to technical decisions in a collaborative, growing team. I'd welcome the opportunity to bring this architecture and systems-integration experience to your Android Automotive project from its early phase.

Best regards,

Maksim Sukhotski
