

Dear DCG Hiring Team, I'm writing to express my interest in the Android BSP Developer role. Over 9 years as an Android engineer, I've worked extensively with Java and the Android SDK, and at Arlo I architected real-time hardware-to-app communication for a Camera UX migration, managing Smart Device integration and BLE connectivity for security features like the Emergency Button. That work also involved building automated quality gates and static analysis into the engineering workflow, which I understand maps closely to the testing and certification rigor your team applies through CTS/GTS/VTs. Beyond hardware integration, I've architected systems from scratch (Halyk Bank), led teams, and driven TDD practices achieving near-100% code coverage on hardware-facing features. I'm drawn to the challenge of working closer to the hardware layer and would welcome the opportunity to discuss how my background in Smart Device integration and systems architecture could contribute to your BSP team. Thank you for your consideration.
