

Dear Hiring Team,

I'm writing to apply for the Senior Android Engineer position on your core mobile engineering team. With 9 years of experience building high-scale B2C native Android applications, I bring deep, hands-on expertise in Kotlin and Jetpack Compose, along with a strong track record of architecting clean, modular, testable systems — including designing a Clean Architecture from scratch for a real-time trading app at Halyk Bank. At Slice, I migrated legacy views to Jetpack Compose and accelerated development speed by 80%, and at Arlo I achieved near-100% code coverage on critical features through rigorous TDD practices with MockK and Espresso. I'm comfortable translating detailed design specifications into fluid, production-grade UI, and I've consistently driven engineering quality through automated testing, CI/CD, and static analysis. I'd welcome the opportunity to bring this architectural rigor and product-minded execution to your mobile team. Thank you for considering my application.

Best regards,

Maksim Sukhotski
