

Dear Hiring Team, I'm writing to apply for the Senior Android Engineer role. With 9 years of experience building high-scale B2C Android applications, including architecting a real-time trading application from scratch at Halyk Bank using Clean Architecture (MVVM), I bring exactly the architectural rigor this role demands. My expertise centers on Kotlin, Coroutines/Flow, and Jetpack Compose, most recently at Zalando and Slice, where I migrated legacy views to Compose and accelerated development speed by 80%. I've consistently driven testing discipline, achieving near-100% code coverage with TDD (MockK, Espresso) at Arlo and Turkcell, and have introduced automated quality gates and CI/CD pipelines across teams. I'm drawn to the opportunity to work in a high-agency environment translating Figma designs into polished Compose UIs while exploring Web3 and crypto wallet integrations at the frontier of fintech. I'd welcome the chance to discuss how my architecture, testing, and B2C delivery experience can contribute to your mobile engineering team.
