

Dear AlphaSense Hiring Team,

I'm excited to apply for the Staff Android Engineer role. Over 9 years I've repeatedly owned Android architecture from the ground up — at Halyk Bank I built a modular Clean Architecture for a real-time trading app and led a team of 5, and at Arlo I architected real-time hardware-to-app communication for smart camera devices while driving TDD practices to ~100% coverage on critical features. I've also driven large-scale platform improvements with measurable impact, including an 80% development speed gain from migrating Slice's legacy views to Jetpack Compose and modular components, and a 90% reduction in delivery bottlenecks through custom CI/CD workflows at Halyk Bank. Beyond hands-on architecture, I've raised engineering standards across teams by mentoring developers, running 50+ technical interviews at Vention, and co-organizing the Belarus Kotlin User Group. I'm drawn to AlphaSense's mission of extending decision-ready workflows to mobile, and I believe my background architecting reliable, high-scale Android systems and setting technical standards for teams aligns well with this Staff-level scope. I'd welcome the opportunity to discuss how I can contribute.

Best regards,

Maksim Sukhotski
